

The background is a mosaic of eight aerial photographs showing various South African landscapes. The top-left shows a river flowing through a rural area with small houses. The top-middle is a large, flat, golden-brown field. The top-right shows a dense green forest. The bottom-left shows a field with patches of orange-brown vegetation. The bottom-middle shows a large, rectangular field with a distinct orange-brown color. The bottom-right shows a dense green forest.

- Wrap up

The background of the slide is a collage of four nature photographs. The top-left photo shows a close-up of a green leaf with prominent veins. The top-right photo is a dense, green forest canopy. The bottom-left photo shows a body of water, possibly a lake or river, with a forested shoreline. The bottom-right photo shows a close-up of a tree trunk with rough bark. The text 'Overview of the project' is centered over the collage.

Replying to [@texturesofut](#)

My tweets contain satellite images of areas approximately 1500 feet wide (good for about a twelfth of a square mile). They are randomly selected from a box drawn around Utah state lines.

**Textures of Utah** 🤖 @texturesofut · Oct 11, 2021

Points are repeatedly checked against a .shp file until a point is selected from within state boundaries. An image corresponding with that point is then queried from the Mapbox API and posted to Twitter using the rtweet package.

## AzureStor: an R package for working with Azure storage

by Hong Ooi, senior data scientist, Microsoft Azure

A few weeks ago, I introduced the [AzureR](#) family of packages for working with Azure in R. Since then, I've also written articles on how to use [AzureRMR](#) to interact with Azure Resource Manager, how to use [AzureVM](#) to manage virtual machines, and how to use [AzureContainers](#) to deploy R functions with Azure Kubernetes Service. This article is the next in the series, and covers AzureStor: an interface to [Azure storage](#).

### The Resource Manager interface: creating and deleting storage accounts

[AzureStor](#) implements an interface to Azure Resource Manager, which you can use manage storage accounts: creating them, retrieving them, deleting them, and so forth. This is done via the appropriate methods of the `az_resource_group` class. For example, the following code shows how you might create a new storage account from scratch.

```
library(AzureStor)

# get the resource group for the storage account
rg <- AzureRMR::az_rm$new(tenant="{tenant_id}", app="{app_id}", password="{password}")$
  get_subscription("{subscription_id}")$
  get_resource_group("myresourcegroup")

# create the storage account
# by default, this will be in the resource group's region
rg$create_storage_account("mynewstorage")
```

Without any options, this will create a storage account with the following parameters:

- General purpose account (all storage types supported)
- Locally redundant storage (LRS) replication
- Hot access tier (for blob storage)
- HTTPS connection required for access

You can change these by setting the arguments to `create_storage_account()`. For example, to create an account with geo-redundant storage replication and the default blob access tier, you would use:

Quarto

# Welcome to Quarto

Quarto is an open-source scientific and technical publishing system built on Pandoc

- Create dynamic content with Python, R, Julia, and Observable.
- Author documents as plain text markdown or Jupyter notebooks.
- Publish high-quality articles, reports, presentations, websites, blogs, and books in HTML, PDF, MS Word, ePub, and more.
- Author with scientific markdown, including equations, citations, crossrefs, figure panels, callouts, advanced layout, and more.

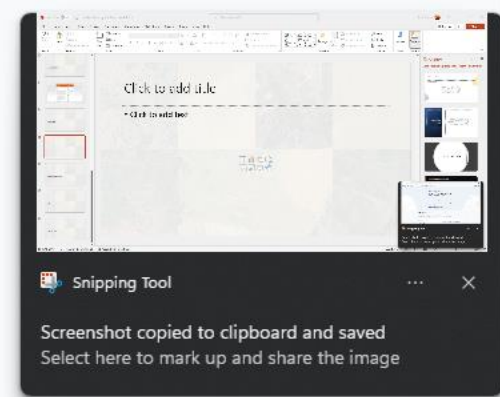

Get Started Guide

## Hello, Quarto

Python R Julia Observable

Weave together narrative text and code to produce elegantly formatted output. Quarto documents are fully reproducible. Use markdown with code cells executed via Jupyter (shown below) or render existing Jupyter notebooks.

```
---
title: "matplotlib demo"
format:
  html:
code-folding: true
```

# Quarto Extensions

Quarto v1.2 Required

If you are using or developing extensions you should [update to Quarto v1.2](#), which includes significant improvements to the extension API. Many extensions are also likely to require Quarto v1.2.

Extensions are a powerful way to modify and extend the behavior of Quarto. Below is a listing of available extensions (please [let us know](#) if you have an extension you'd like to see added to the list).

See the articles on [Creating Extensions](#) to learn how to develop your own extensions.

The background is an aerial photograph of a landscape, possibly a wetland or coastal area, with various shades of green, brown, and blue. Overlaid on this is a grid of semi-transparent colored rectangles. The top row consists of four rectangles: a light green one on the far left, a light yellow one, a light blue one, and a light orange one on the far right. The bottom row consists of three rectangles: a light green one on the far left, a light yellow one, and a light blue one on the far right. The text 'sf' is located in the bottom-left rectangle, which is light green.
